

The Settings menu is new in Windows 10. Here you change most of your PC's settings. The Fall Creators Update added a **Phone** icon, where you can integrate the PC with your smartphone, and a **Cortana** icon where you can select your digital assistant preferences.

You can also manage your devices from the older Control Panel app – via Start, Windows System, Control Panel, **Devices and Printers**.

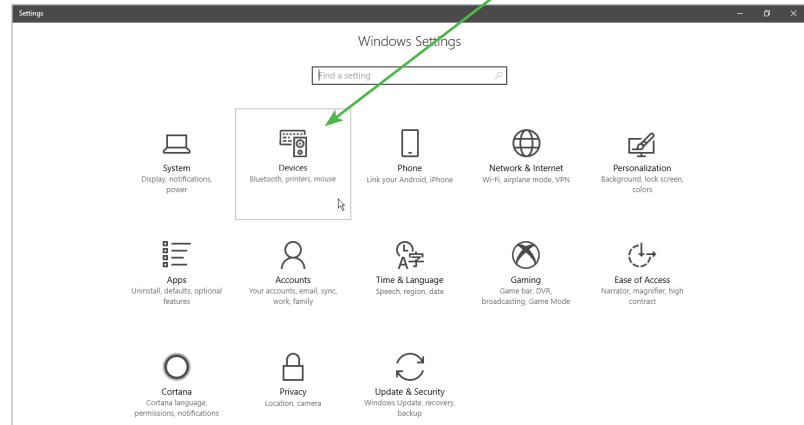

It is important to remove devices from your PC in the correct way. Simply disconnecting them can cause problems.

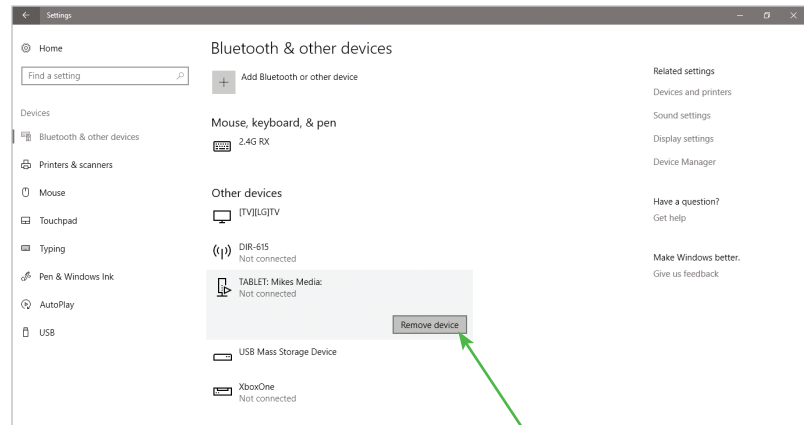

PC settings – devices

Windows has always provided a device management utility called Device Manager with which users can manage devices on their computer. The Windows 10 interface provides a simpler option to add and remove devices, troubleshoot device issues, and more:

- 1 Click the Start button, then select **Settings**
- 2 In the Settings window, choose **Devices**

- 3 Now, choose **Bluetooth & other devices** and you will see a list of all the devices connected to your computer

- 4 Clicking on a device reveals a **Remove device** option, which can be used to uninstall the device safely
