

...cont'd

Outlook also provides protection from messages even when they are allowed into the Inbox:

- Links to pictures on the sender's website may be blocked, links to websites may be disabled, and you may not be allowed to use the **Reply** and **Reply All** functions.
- To explore how Outlook handles potentially damaging messages, visit the website **docs.libraesva.com** and select the **Email Security Tester** link. Submit an email address and respond to the confirming email.

- Review the subsequent emails you receive from this website to see how Outlook responds to the various scenarios. For example, Outlook blocks access to an attachment that's executable and so potentially dangerous.

Links to pictures and other content from a website may be blocked, since these are sometimes the source of viruses and other threats. Only download them if you trust the sender.

Some spam messages and websites try to trick you into providing passwords, PINs, and personal details. Known as phishing (pronounced "fishing"), they appear to be from well-known organizations such as banks, credit card providers, and charities.

The attachments and links in these test emails are innocuous, but do illustrate ways in which the security of your system could be impacted.
